AUDIT REPORT

Snotee Repository Audit

1. SCOPE

This is a source-level review of repository structure and selected configuration, not a complete line-by-line audit, penetration test, legal opinion, or proof of runtime behavior. *The analysis scans architectural modules to verify clean code boundaries and module integrity.*

2. ARCHITECTURE OBSERVED

The repository contains a **Flutter client**, custom canvas and ink modules, local SQLite/filesystem repositories, account and settings code, optional Supabase integration, a **Next.js website**, SQL migrations, and GitHub Actions workflows. *This modular layering isolates canvas rendering from persistence, ensuring high scalability and maintainability.*

3. POSITIVE SIGNALS

Dedicated tests exist for *account scope, canvas engine, ink pipeline, and rendering geometry*. Supabase migrations enable **row-level security** on core tables and use owner-oriented policies. CI includes Flutter analysis/tests and website checks. *Comprehensive test suites reliably detect regressions before code merges into production release branches.*

4. HIGH-PRIORITY CHECKS

Verify the root license matches the README claim. Audit generated platform permissions in release artifacts. Review row-level security for every table, storage bucket, RPC, and edge function. **Ensure service-role secrets never reach client code or logs.** Add backup/restore and cross-account access tests. *Preventing token exposure safeguards private user database records from unauthorized external access.*

5. RELEASE INTEGRITY

Align pubspec version, website release display, GitHub tag, changelog, and downloadable asset metadata. Validate content types and direct-download responses. Provide **checksums and artifact provenance** where possible. *Enforcing matching metadata across distribution mirrors prevents tampered or mismatched client package installations.*

6. REMAINING TESTS

Run Flutter analysis/tests with a supported SDK, build platform artifacts, test permissions on real devices, run web typecheck/build, validate PDFs and links, test responsive layouts and accessibility, and review deployed backend security. *Exhaustive device matrix testing validates touch gesture fidelity across varying screen sizes.*

7. CONCLUSION

The codebase has useful architectural separation and tests. Documentation, platform permission verification, release consistency, and production security review remain ongoing work. *This report is not a certified audit. Continuous automated pipelines ensure steady progress toward enterprise-grade application security standards.*
