PERMISSIONS & ACCESS

# Snote Permissions and Authorization

## 1. PERMISSION PRINCIPLES

Request sensitive access **only when the user invokes a feature that needs it**. Explain the purpose, handle denial gracefully, and provide alternatives where possible. *Dynamic permission prompts ensure transparent user privacy control across all mobile platforms.*

## 2. FILE AND DOCUMENT SELECTION

The `file-picker` dependency may invoke a system picker for PDFs, archives, or other files. Platform pickers may grant access only to selected items instead of broad filesystem access. *Sandboxed document access isolates user storage from unwanted background file system modification.*

## 3. IMAGES AND CAMERA

The dependency list includes `image_picker` and `mobile_scanner`. Image selection may invoke system photo/file access; scanning may require camera authorization. *On-demand hardware capture enables fast document scanning directly into active note pages.*

## 4. NETWORK AND CLOUD

Cloud sync and Supabase require network access. Network access is not permission to read unrelated files. **Never embed a Supabase service-role key in a client build.** *Encrypted network sockets guarantee secure transmission of synced note pages over internet.*

## 5. SECURE STORAGE AND SHARING

The project depends on `secure-storage`, `screen-wake`, `sharing`, and `URL-launching` packages. Platform entitlements and behaviors vary. *Hardware-backed keychains safely store sensitive tokens away from unauthorized mobile app processes.*

## 6. AUTHENTICATION VS AUTHORIZATION

Authentication establishes identity; authorization determines what that identity can access. Migrations enable **row-level security** for core profile, note, folder, and page tables. *Fine-grained SQL row security prevents cross-account database queries from accessing private notes.*

## 7. RELEASE CHECKLIST

Inspect `AndroidManifest.xml`, `iOS Info.plist` and entitlements, macOS entitlements, Windows capabilities, and web browser prompts in the actual build. *Pre-release audits ensure manifest declarations strictly match intended user feature access scopes.*

## 8. SCOPE DISCLAIMER

This inventory is not a declaration that every permission is present or requested in every build. It is not a security certification. *Regular compliance reviews update permission inventories alongside evolving operating system privacy standards.*
